

Geometry Unit 1 Review

Day 1.

Distinguish between Euclidean and non-Euclidean Geometry.

For each of the following, determine whether they demonstrate a Euclidean or a non-Euclidean Geometry.

Explain how you are able to distinguish between Euclidean and non-Euclidean Geometry.

Day 2.

Identify how many dimensions an object has.

Give an example of an object with...

0 dimensions: _____

1 dimension: _____

2 dimensions: _____

3 dimensions: _____

Just by looking at an object, how can you tell how many dimensions it has?

Day 3.

Identify vocabulary words on a diagram using appropriate notation.

Use the following diagram to find examples of each of the following. Be sure to use appropriate notation.

Three collinear points: _____

You should have three capital letters separated by commas.

Three non-collinear points: _____

You should have three _____ letters separated by _____.

A line: _____

You should have _____ capital letters separated by _____ with a _____ on top.

A line using a different notation: _____

You should have one _____ letter in cursive.

A plane: _____

You should have _____ capital letters separated by _____ with nothing on top.

A plane using a different notation: _____

You should have one _____ letter in _____.

Four coplanar points: _____

You should have four _____ letters separated by _____ with _____ on top.

A ray: _____

You should have _____ capital letters separated by _____ with _____ on top.

A segment: _____

You should have _____ capital letters separated by _____ with _____ on top.

Day 4.

Find the slopes of lines and write an equation given points and a graph.

Find the slopes of each of the lines below. Then, write their equation.

(3, 2) and (4, -1)

(-2, 5) and (-8, 0)

(1, 5) and (1, -7)

Day 6.

Use the Segment Addition Postulate to solve for lengths of segments.

Find AB and CD :

If $AC = 48$, solve for x . Then, solve for AB and BC .

Solve for x .

Find the distance between two points on a coordinate plane.

Find the distance between each of the following points.

(3, 2) and (4, -1)

(-2, 5) and (-8, 0)

(1, 5) and (1, -7)

Day 7.

Use both the Segment Addition Postulate and the Bisector Theorem to solve for lengths of a segment.

In the diagram below, solve for x .

In the diagram below, solve for x .
